

ABSTRACT OF THE DISCLOSURE

A switch operation detecting unit 4 for detecting an operation of a switch 1, a rotary encoder 2, or a touch panel 3, and a cursor operation detecting unit 6 for detecting a movement of a cursor for indicating a selection item shown on a display 5 provide a speech input guidance central controlling unit 7 with signals. The speech input guidance central controlling unit 7 reads out data from a speech input guidance data accumulating unit 21 for accumulating and recording speech input commands corresponding to individual operations, a speech input guidance output count, and a speech input executing count, and provides speech input guidance by speech or as an image. In this state, if it is detected that an audio device is operating, the speech input guidance output count or the speech input executing count exceeds a predetermined count, either or both of the speech guidance and the image display guidance are stopped
